In mathematics, and more specifically in graph theory, a graph is a structure amounting to a set of objects in which some pairs of the objects are in some sense "related". The objects correspond to mathematical abstractions called vertices (also called nodes or points) and each of the related pairs of vertices is called an edge (also called an arc or line).

In statistics, the standard score is the signed number of standard deviations by which the value of an observation or data point is above the mean value of what is being observed or measured. Observed values above the mean have positive standard scores, while values below the mean have negative standard scores. The standard score is a dimensionless quantity obtained by subtracting the ...

The natural logarithm  $\ln x$  is the logarithm having base  $e$ , where  $e=2.718281828\dots$  (1) This function can be defined  $\ln x = \int_1^x \frac{dt}{t}$  (2) for  $x > 0$ . This definition means that  $e$  is the unique number with the property that the area of the region bounded by the hyperbola  $y=1/x$ , the  $x$ -axis, and the vertical lines  $x=1$  and  $x=e$  is 1. In other words,  $\int_1^e \frac{dx}{x} = \ln e = 1$ .

Box and Cox (1964) developed the transformation. Estimation of any Box-Cox parameters is by maximum likelihood. Box and Cox (1964) offered an example in which the data had the form of survival times but the underlying biological structure was of hazard rates, and the transformation identified this.
