The habitability of red dwarf systems is determined by a large number of factors from a variety of sources. Although the low stellar flux, high probability of tidal locking, small circumstellar habitable zones, and high stellar variation experienced by planets of red dwarf stars are impediments to their planetary habitability, the ubiquity and longevity of red dwarfs are positive factors.

On February 2, 2011, the Kepler Mission revealed the detection of 54 potential planetary candidates which orbit their host star within or near its apparent habitable zone -- where liquid water can exist on the surface of an Earth-type planet. Five of these planets are near Earth in size, but they orbit stars that are smaller, dimmer, and more orange-red than our own Sun, Sol.
